Green Gas (SNG) in the Dutch Energy Infrastructure

Green Gas (SNG) in the Dutch Energy Infrastructure *Potential & Implementation*

Dr. ir. Harold Boerrigter
Energy research Centre of the Netherlands (ECN)
ECN Biomass, Coal & Environmental research

Content

- Introduction on ECN
- Definitions
- Motivation for Green Gas
- Potential & application
- Green Gas & SNG implementation
- Biomass availability and import
- Economy of SNG production
- SNG development trajectory
- Conclusions

Energy research Centre of the Netherlands in the dunes of North Holland

- Independent energy research institute
- Founded in 1955
- 650 staff
- Annual turnover: 80 million EURO
- Activities:
 - Biomass & Coal
 - Solar
 - Wind
 - Fuel Cells
 - CO₂ Capture & Storage
 - Energy Efficiency
 - Policy Studies

www.ecn.nl

ECN in a glance

Mission

- ECN is the largest, independent, market oriented, and innovative Dutch energy research institute.
- A sustainable development is the guiding principle for all ECN activities.
- ECN investigates and develops technologies and products for a safe, efficient, and environment-friendly energy supply.
- ECN bridges the gap between research and market application.

ECN develops high-quality knowledge and technology for the transition to a sustainable energy supply

Definition of "Green Gas"

Biogas and SNG

Biogas	- produced by digestion, contains mainly CH ₄ and CO ₂
Landfill gas	- product of landfills, composition similar to biogas
SNG	- "Synthetic Natural Gas", contains mainly CH ₄ - produced via gasification followed by methanation - main sources: coal and biomass
bio-SNG	- SNG from biomass
"green natural gas" or "green gas"	- comprising both bio-SNG and upgraded biogas/landfill gas - complies with specifications for injection to natural gas grid - has same properties as natural gas - can be used in all existing equipment
Syngas	- synthesis gas: H ₂ and CO (and CO ₂ and H ₂ O); of fossil origin - produced via gasification or reforming of coal, oil residues, or natural gas
Biosyngas	- biomass origin; chemical identical to syngas - produced via high-temperature (>1200°C) or catalytic gasification
Product gas	- produced via low-temperature (<1000°C) gasification - contains H ₂ , CO, CH ₄ , C _x H _y incl. tar (and CO ₂ and H ₂ O)

Synthetic Natural Gas (bio-SNG)

Production & applications

“Green Gas” for one household for one year

(7) ECN Biomass, Harold Boerrigter Wetsus Workshop "Energy", 30 March 2006, Leeuwarden www.ecn.nl

Biogas and SNG

Characteristics

Green Gas	=	Upgraded Biogas	+	Synthetic Natural Gas (SNG)
<ul style="list-style-type: none"> • Technology: • Status: • Implementation: • Production scale: • Potential: • Feedstock: 		<ul style="list-style-type: none"> digestion / landfill commercially available today small (~300 kW) limited (< 60 PJ) wet biomass (available) 		<ul style="list-style-type: none"> gasification & methanation in development after 2010 large (~1,000 MW) unlimited (> 240 PJ) dry biomass (import required)

(8) ECN Biomass, Harold Boerrigter Wetsus Workshop "Energy", 30 March 2006, Leeuwarden www.ecn.nl

Why (Green) Gas?

International energy developments

- Security of supply
 - decrease dependency on one politically unstable region (crude oil)
 - energy as political 'pressure tool', i.e. Russia (for natural gas)
- Increasing prices of fossil fuels
 - fast growing economies China & India
- Fuel diversification
 - decrease dependency on oil
 - use coal, biomass, and natural gas (LNG)
- Depleting resources of fossil fuels
 - crude oil (20-40 years)
 - natural gas (40-60 years)
 - coal (~200 years)
- Natural gas is solution for medium-long term

(9) ECN Biomass, Harold Boerrigter Wetsus Workshop "Energy", 30 March 2006, Leeuwarden www.ecn.nl

Why Green Gas?

Environmental considerations

- Reduction of Greenhouse Gas (GHG) emissions
 - Kyoto protocol (CO₂)
- Agricultural development
 - production of biomass in EU-25
 - job creation & rural development
- Local emissions
 - gas is a clean fuel
 - reduce local emissions from transport
 - EU targets for natural gas as transport fuel
- Implementation
 - natural gas market is growing
 - Green Gas is additional to natural gas
 - in time Green Gas can compensate for decrease in natural gas

(10) ECN Biomass, Harold Boerrigter Wetsus Workshop "Energy", 30 March 2006, Leeuwarden

www.ecn.nl

Why Green Gas?

Netherlands situation

- Security of supply is not a big issue (for natural gas)
- Renewable energy targets are main driver (Kyoto)
 - substitution of 10% primary energy by renewables in 2020
 - biofuels: 2% in 2005, 5.75% in 2010, and 15% in 2020
- "Energy Transition" of government
 - 30% substitution of primary energy by renewables in 2040
- Energy Transition Working Group "Green Gas" (proposal):
 - => 20% substitution of natural gas by Green Gas in 2030

(11) ECN Biomass, Harold Boerrigter Wetsus Workshop "Energy", 30 March 2006, Leeuwarden

www.ecn.nl

Potential of Green Gas

Netherlands situation

- In the Netherlands (2004), in total 3,300 PJ primary energy is consumed:

[PJ/y]	Coal	Crude oil	Natural Gas	Other	Total
Electricity	200	10	350	300	860
Transport	.	480	.	10	490
Heat	40	240	1,100	20	1,400
Chemistry	70	370	90	20	550
Total	310	1,100	1,540	350	3,300

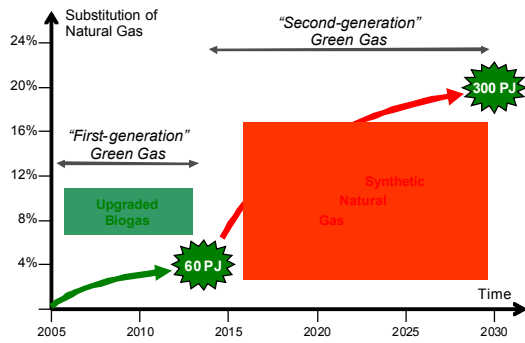

- 20% natural gas substitution = 300 PJ "Green Gas"
- Large potential for Green Gas = **HEAT**
 - 40% of heat is used by distributed small consumers (i.e. households)
 - 96% of this heat is from natural gas combustion

(12) ECN Biomass, Harold Boerrigter Wetsus Workshop "Energy", 30 March 2006, Leeuwarden

www.ecn.nl

Green Gas implementation

Target: 20% substitution (300 PJ) in 2030

(13) ECN Biomass, Harold Boerrigter Wetsus Workshop "Energy", 30 March 2006, Leeuwarden

www.ecn.nl

Green Gas / SNG for renewable heat

Advantages (1)

The advantages of SNG for distributed heat production are:

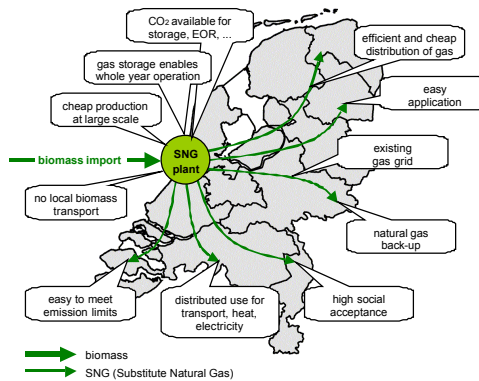

- large-scale production / small-scale utilization
- gas storage: production all year
- efficient distribution: 1% (S)NG loss vs. typically 15% energy loss in heat distribution systems
- no new infrastructure needed
- SNG combustion: easy-to-meet local emission limits
- high social acceptance
- natural gas back-up (security of supply!)
- ease of introduction: only few industrial partners, but many end-users
- free market possibility (similar to green electricity)

(14) ECN Biomass, Harold Boerrigter Wetsus Workshop "Energy", 30 March 2006, Leeuwarden

www.ecn.nl

Green Gas / SNG for renewable heat

Advantages (2)

(15) ECN Biomass, Harold Boerrigter Wetsus Workshop "Energy", 30 March 2006, Leeuwarden

www.ecn.nl

Green Gas / SNG for renewable heat

Alternatives

- Local biomass combustion
Disadvantages: large number of small-scale plants in populated areas, relative expensive due to small scale
- Combined Heat & Power (CHP) plants
Disadvantages: large number of small-scale plants, relative expensively due to small scale, electricity and heat demand not in balance
- All electric heating
Disadvantages: new equipment, new power capacity and network expansion required, only high efficiency combined with (expensive!) heat pumps

=> **SNG is the best route for the large-scale production of renewable heat**
large-scale centralized production plants, transport via existing gas grid, local consumption, clean conversion

(16) ECN Biomass, Harold Boerrigter Wetsus Workshop "Energy", 30 March 2006, Leeuwarden

www.ecn.nl

Green Gas implementation

Required SNG production capacity

- Biomass feedstock is imported in the Netherlands
- Biomass available in large amounts in few harbours
- Typical SNG production plant = 1,000 MW_{th}
- Total 12 plants required
- Total annual biomass consumption:
 - 20 million tonnes per year
 - 1.7 million tonnes per plant
- Is that a lot? **YES!**
- Is that unrealistic? **NO!**

(17) ECN Biomass, Harold Boerrigter Wetsus Workshop "Energy", 30 March 2006, Leeuwarden

www.ecn.nl

Is there enough biomass??

Two approaches

**Yes, there is enough biomass...
to be a serious option for renewable energy
generation and SNG production**

(18) ECN Biomass, Harold Boerrigter Wetsus Workshop "Energy", 30 March 2006, Leeuwarden

www.ecn.nl

Required biomass import

References (1)

Harbour	Position	Share	Transshipment [million tonnes per year]			
			Total	Coal	Crude oil & Oil products	Ores & Minerals
Netherlands	-	100%	463.8	46.7	160.7	71.0
Rotterdam	1	76%	352.0	25.3	136.0	50.0
Amsterdam	2	11%	50.0	12.7	16.0	6.4
IJmuiden	3	4%	18.0	5.8	0.3	9.0
Delfzijl & Eemshaven	7	0.5%	2.3	0.008	0.013	1.2

- Total biomass requirement for SNG
 - same range as today's coal transshipment in Rotterdam
 - 4.3% increase for total Netherlands transshipment (in 2030)
- Biomass for one plant
 - would double transshipment in Delfzijl

(19) ECN Biomass, Harold Boerrigter Wetsus Workshop "Energy", 30 March 2006, Leeuwarden

www.ecn.nl

Required biomass import

References (2)

Organic materials (2000) [kton/year]	Import	Export	Transshipment
Wood & Pulp	7,010	3,462	10,472
Oil seeds	7,133	1,845	8,978
Meat, Fish & Dairy	2,995	5,028	8,023
Cereals	6,413	630	7,043
Sugar & Cacao	1,926	1,856	3,782

- Total biomass requirement for SNG
 - double of today's wood & pulp transshipment
- Biomass for one plant
 - same order as today's import of sugar & cacao
 - today's cereals transshipment equals biomass import for three SNG plants

(20) ECN Biomass, Harold Boerrigter Wetsus Workshop "Energy", 30 March 2006, Leeuwarden

www.ecn.nl

Economy

For large-scale SNG production in 2030

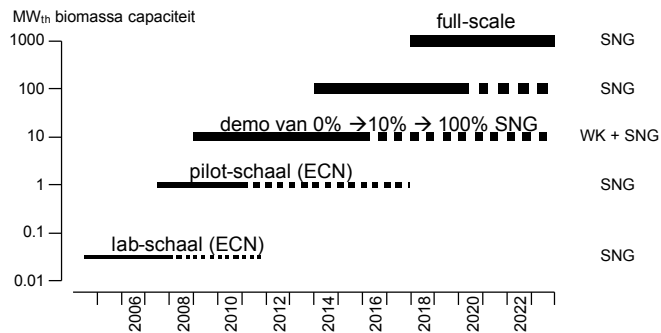

- The projected long-term production costs of SNG = $\sim 10 \text{ €/GJ}_{\text{SNG}}$
- Additional costs:
 - 4 €/GJ, with a natural gas price = 6 €/GJ
 - equivalent to $\sim 1.5 \text{ €/kWh}$ electricity
 - carbon costs: $\sim 75 \text{ € per ton CO}_2$
- Support options:
 - subsidy (e.g. "Gas MEP") of 4 €/GJ
 - establishment of CO₂ trading market
 - additional costs of $\sim 2.0 \text{ €/t}$ for each m³ gas consumed
- But what happens to the natural gas price in 2030?
 - increase to level of SNG production costs
- Financial support required for Development and Demonstration
 - new technology
 - first plants are small scale

www.ecn.nl

Implementation trajectory

Phased approach

(22) ECN Biomass, Harold Boerrigter Wetsus Workshop "Energy", 30 March 2006, Leeuwarden

www.ecn.nl

SNG demonstration project

Slipstream SNG

Possible line-up of demonstration project

- 10 MW_{th} biomass gasifier (~15 kton/jr)
- Production of green electricity with boiler-firing
- low risk, direct profit
- slipstream gas for demonstration
- product gas cleaning & "Green Gas"
- attractive demo (subsidies)

(23) ECN Biomass, Harold Boerrigter Wetsus Workshop "Energy", 30 March 2006, Leeuwarden

www.ecn.nl

Conclusions

- Natural gas increasingly important as fuel for medium-long term
- Green Gas important as renewable fuel
- Green Gas comprises biogas and SNG; SNG will be main source
- SNG mainly for heat in the Netherlands, excellent existing infrastructure
- Biomass import required to meet targets
- sufficient biomass available globally
- logistics easily adaptable in existing infrastructure
- Today, SNG is more expensive than natural gas
- but SNG is more attractive option and most green electricity routes
- Implementation via phased approach with stepwise larger plants
- Development & Demonstration requires financial support
- SNG offers excellent opportunities for Dutch industry.

ECN Biomass, Coal & Environmental Research Programme & Mission

*Development of knowledge, concepts and (conversion) technologies
for a cleaner environment and a sustainable use of biomass and/or coal
for the production of energy, fuels and products.*

Biomass research program

- Gasification and Gas Conditioning
- Heat and Power production
- Biofuels and Refinery Processes

Environmental research program

- Air Quality and Climate Change
- Environmental Risk Assessment
- *Emission Reduction Technology*
